Springfields Fuels reduces operating costs, and obtains greater reliability for the future, as they replace their VAX hardware and migrate a key application from OpenVMS to a more flexible Windows Server environment.

The Customer
Springfields Fuels (formerly British Nuclear Fuels Ltd) is the site of the UK's main nuclear fuel manufacturing operations.

Springfields was the first plant in the world to make nuclear fuel for commercial power stations and has the technology to manufacture fuel for all major designs of nuclear reactors worldwide. Most of the fuel requirements for the UK's nuclear power stations are met by Springfields.

The Challenge
Springfields Fuels has provided products and services to over 140 reactors in 12 countries. Its Control Systems application software controls the manufacture of fuel elements for nuclear stations.

All production control data is fed into a shared proprietary OpenVMS-based Rdb database. The applications ran under OpenVMS on HP (DEC) VAX server hardware and were written in Pascal and C using the Rdb database and DCL scripting language.

According to Martin Heaton, Control Systems Development Manager: “The plant is currently being modernised and the replacement of the VAX hardware is part of this modernisation. There are no possible package replacements for our unique software applications - so migration offered the quickest, cheapest and lowest-risk option for us to move from this ageing DEC VAX platform to an open, and more flexible, Windows Server environment.”

The Solution
We migrated Springfields Fuels' critical Control Systems application to an open and more flexible Windows Server environment using the Advanced toolset for OpenVMS to automate the majority of the migration process.

The toolset converted the application to run in an HP Proliant Windows Server 2003 Enterprise Edition environment.

The Pascal code was converted to C and, together with the applications' C code, was transferred to operate on the target platform with Oracle 10g replacing the proprietary Rdb database.
Springfields migrates application from OpenVMS

The Advanced Open Libr8 product was utilised to support the replacement of the OpenVMS systems services, and Advanced Open DCL was employed to replace the DCL scripts.

**Major Benefits**

With the application now in a single programming language, Springfields Fuels is able to maintain it within the more productive Microsoft Visual Studio development environment.

Springfields Fuels will reduce their operating costs and obtain greater reliability for the future.

Heaton concludes: "The migration and roll-out of the application has been highly successful. Advanced has demonstrated that it has the methodology, software tools and skills to deliver complex projects on time, to budget and to a high level of quality."

“**There are no possible package replacements for our unique software applications - so migration offered the quickest, cheapest and lowest-risk option for us to move from this ageing DEC VAX platform to an open, and more flexible Windows Server environment.**”
